

Medicine Store Dashboard

How the inventory and citizen-request workflow works, end to end.

The Medicine Store Dashboard is the single source of truth. The store manager owns the inventory and every stock number; the citizen app only ever shows medicines the store has marked active and in stock. Nothing on the citizen side can change stock directly — only a manager decision on a request can.

Figure 1 — top row: how a medicine enters inventory. Bottom row: how a citizen request moves from submission to completion.

1. Adding a medicine to inventory

From the dashboard, the manager taps **Add Medicine** and fills in one form: **name**, **description**, **strength** (e.g. 250mg, 500mg, 5ml), **manufacturer**, **batch number**, **expiry date**, **unit** (tablet, strip, bottle...), **price**, **stock quantity**, and the **low-stock threshold**. Saving creates one record in the store's inventory.

2. Managing inventory

The Inventory screen lists every medicine with its price, unit, current stock and a live stock badge. Tapping an item opens the same form pre-filled, so the manager can correct any detail or update the stock count after a delivery. Removing a medicine hides it from every list (the store's and the citizen's) without deleting it — so past requests that reference it stay intact for the store's records.

3. Low stock — fully automatic

Stock status is never typed in by anyone — it is calculated every time the inventory is read, from two numbers the manager already set:

Stock quantity	Badge shown
0	Out of Stock
1 – low-stock threshold (e.g. ≤ 10)	Low Stock
Above the threshold	In Stock

Because the badge is recalculated live, it can never go stale: the moment stock is edited or a request is completed, the badge and the dashboard's "Low Stock" count reflect it immediately.

4. How a citizen request is received

A citizen can only see and request medicines that are **active** and have **stock > 0**. Requesting one submits the medicine, a quantity, and an optional note. The request is created with status **Pending** and appears on the Store Dashboard immediately — both in the live "Pending Requests" preview and on the full Requests screen.

5. How the store processes a request

Status	Meaning	Who acts / next step
Pending	Just submitted by the citizen	Manager: Accept or Reject
Accepted	Store confirms it can fulfil it	Manager: mark Ready for Pickup
Ready for Pickup	Set aside, citizen can collect	Manager: mark Completed on hand-over
Completed	Handed to the citizen	Stock reduced automatically — final
Rejected	Store cannot fulfil it	Ends here — stock untouched — final

Rejected and Completed are final — once a request reaches either of those, it cannot move again. Every decision (accept, reject, mark ready, complete) is stamped with the manager who made it and when.

6. Stock update — automatic, and only once

Stock is **not** touched when a request is accepted or marked ready — only when it is marked **Completed** (the medicine has actually been handed over). At that moment the store's stock quantity is reduced by the requested amount in a single database transaction, so it can never be double-counted or missed. If that pushes the remaining quantity to or below the low-stock threshold, the badge and dashboard count update on the very next screen view — no manual step required.

Summary: Add → Inventory → (auto) Stock status → Citizen request → Pending → Accepted → Ready for Pickup → Completed → (auto) Stock reduced.
